FULL-STACK SOFTWARE DEVELOPER | BACKEND & API DEVELOPMENT | REACT/ NODE.JS/ JAVA

PROFESSIONAL SUMMARY

Full-stack software developer with 5 years of experience building and supporting web applications, REST APIs, and business systems using TypeScript, React, Node.js/Express, Java/Spring Boot, and SQL/NoSQL databases. Experienced across frontend and backend development, API design, database performance, authentication and RBAC, Redis caching, Docker, cloud environments, CI/CD workflows, and production support. Built applications spanning research, pharmacy fulfillment, localization, ERP, and payment operations, taking features from requirements and design through development, testing, deployment, and ongoing support. Strong in Agile development, Git-based workflows, code reviews, troubleshooting, and working with technical and non-technical stakeholders.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript (ES6+), Java, SQL, HTML5, CSS3
Frontend: React.js, Tailwind CSS, Ant Design, jQuery, AJAX, Responsive Web Design
Backend & APIs: Node.js, Express.js, Spring Boot, REST API Design & Versioning, JWT Authentication, Role-Based Access Control (RBAC), Postman
Databases & Performance: MySQL, PostgreSQL, MongoDB, Redis, JPA, Schema Design, Indexing, Query Optimization, Connection Pooling
Cloud & Infrastructure: AWS, EC2, S3, CloudWatch, Azure Blob Storage, Docker, Linux
Testing & Quality: Jest, JUnit, Unit & Integration Testing, API Testing, Code Review, Data Validation, Production Debugging
DevOps & Collaboration: Git, GitHub, GitLab, CI/CD, Jira, Confluence, Agile/Scrum, Technical Documentation
Enterprise Platforms: NetSuite, SuiteScript 2.x, RESTlets, Saved Searches, SuiteAnalytics, ERP Integrations
Analytics: Google Analytics 4, Google Tag Manager, Google Search Console
AI-Assisted Development: GitHub Copilot, Claude Code, AI-Assisted Code Generation, Test-Case Drafting, Code Review & Validation

WORK EXPERIENCE

Application Developer — Feb 2026 – Present

DSHB (Developmental Studies Hybridoma Bank) • Iowa City, IA

- Design and build internal and external web applications using TypeScript, React, Node.js/Express, and MySQL, taking features from requirements and database design through development, testing, deployment, and production support.
- Developed the DSHB Depositor Portal with a TypeScript/React frontend, layered Node.js/Express REST API, and MySQL backend, allowing external researchers to submit antibody and hybridoma deposits and track review status online.
- Designed REST endpoints for deposit records with JWT authentication and RBAC, using Express middleware to scope researcher access to their own records while allowing authorized staff to manage broader datasets.
- Normalized researchers, institutions, antibody/antigen data, and review status into related MySQL tables with foreign keys and indexes for search and filtering performance.
- Implemented MySQL connection pooling to reuse database connections across requests and keep list, search, and status pages responsive during concurrent use.
- Built internal React/TypeScript tools and workflow screens for staff, translating manual and spreadsheet-based processes into web-based forms, dashboards, and data-management workflows.
- Developed NetSuite integrations using SuiteScript, jQuery, AJAX, and RESTlets to retrieve and update product information and support the DSHB public website.
- Built a React-based blog interface that retrieves content from NetSuite records through REST APIs, allowing non-technical staff to create and manage website content without direct code changes.
- Administered NetSuite users, roles, permissions, custom fields, forms, saved searches, and scheduled reports supporting orders, deposits, and fulfillment operations.
- Deployed a self-hosted NocoDB environment with Docker and connected it to internal data, giving staff a filterable interface for operational data without requiring ad hoc developer queries.
- Use Git-based workflows, code reviews, testing, and environment-based deployments to release application changes and troubleshoot issues across frontend, backend, and database layers.
- Use AI-assisted tools such as GitHub Copilot and Claude Code for boilerplate, implementation ideas, and test-case drafts, reviewing and testing generated code before integration.

Application Developer — Aug 2023 – Jan 2026

Optum Rx • Remote

- Developed and supported full-stack healthcare applications using React, Tailwind CSS, Ant Design, Node.js/Express, MongoDB, and Redis, giving pharmacy fulfillment teams centralized visibility into medication inventory, prescription dispatches, shipments, and home-delivery status.
- Built REST APIs for medication intake, inventory updates, prescription dispatch, shipment tracking, and delivery-status workflows with request validation, authentication, authorization, and consistent error handling.
- Worked with healthcare and pharmacy-related data while following HIPAA-focused data handling, access-control, and security practices, limiting application access according to user responsibilities and minimizing unnecessary exposure of sensitive information.
- Designed MongoDB collections for medications, supplies, inventory transactions, dispatch orders, and delivery history, adding compound indexes for frequently filtered fields such as fulfillment center, status, and date.

- Added Redis caching for frequently requested inventory and dispatch metrics, with explicit cache invalidation after database updates to keep operational dashboards current.
- Built responsive React interfaces for fulfillment and pharmacy teams, including inventory views, dispatch workflows, shipment tracking, delivery updates, filters, and operational dashboards.
- Containerized Node.js services and MongoDB/Redis dependencies with Docker, using environment-specific configuration to maintain consistent development, testing, and deployment environments.
- Supported application deployment in AWS cloud environments, working with EC2-hosted application services, S3-based file storage, CloudWatch logs, and IAM-controlled access while troubleshooting application and environment issues.
- Worked with CI/CD workflows for automated builds, testing, packaging, and deployment across development, test, and production environments, validating releases before promotion.
- Used Git/GitHub for branching, pull requests, code reviews, and release management, and created automated/API-level tests to catch regressions before production.
- Investigated production issues by reproducing reported behavior, reviewing application and CloudWatch logs, tracing requests across React, Node.js, MongoDB, and Redis, and deploying verified fixes.
- Used AI-assisted development tools for implementation support, debugging, documentation, and test-case generation while reviewing and modifying generated code before integration.

Associate Globalization Developer **Aug 2021 – Nov 2022**

TIBCO Software (now Cloud Software Group) — Localization Engineering • Hyderabad, India

- Developed backend services using Java and Spring Boot for MOLEE, an internal translation-management platform, with separate service, business, and data-access layers for maintainable application development.
- Designed and maintained REST APIs connecting the translation platform with internal build systems and external translation vendors, handling JSON/XML payloads, validation, error handling, and translation-job status updates.
- Built Java processing components for XLIFF, .properties, and JSON files, validating structure, required keys, character encoding, and localization data before files moved through downstream workflows.
- Used Spring Data JPA and SQL to retrieve and update translation records, track project and language status, and support reporting and workflow processing.
- Developed and tested backend functionality in AWS-hosted environments, working with EC2 application instances and environment configuration while troubleshooting service behavior and deployment issues.
- Used Amazon S3 for application-related file storage and transfer workflows where translation files needed to be retained or exchanged between processing steps.
- Used CloudWatch logs to review application behavior and troubleshoot backend errors, failed processing jobs, and deployment-related issues in cloud environments.
- Containerized Java/Spring Boot services with Docker, creating repeatable application environments and reducing differences between local development and shared testing environments.
- Supported CI/CD workflows for Java applications by preparing code for automated builds, test execution, packaging, and deployment through development and staging environments.
- Used Git and Git-based code review workflows for branching, pull requests, change tracking, and collaboration with developers and QA engineers.
- Wrote and maintained unit and integration tests for Spring Boot services and REST APIs, covering business logic, validation, database interactions, and common error scenarios.
- Worked with QA engineers to reproduce defects involving localization, character encoding, date and number formatting, and UI text rendering, then verified fixes across development and staging environments.
- Improved backend processing performance by identifying unnecessary database calls, consolidating queries, and reducing repeated data processing in Java services.
- Supported production releases by reviewing application logs, reproducing reported issues, tracing failures through Java services and database operations, and validating fixes before deployment.
- Worked in an Agile team with developers, QA engineers, localization specialists, and project stakeholders to deliver backend features, resolve defects, and support application releases.

EDUCATION

M.S. in Computer Science **Dec 2024**

Saint Louis University, St. Louis, Missouri, USA

B.Tech in Computer Science **Jul 2021**

Gokaraju Rangaraju Institute of Engineering & Technology, Hyderabad, India
