FULL-STACK SOFTWARE DEVELOPER | REACT · TYPESCRIPT · NODE.JS · JAVA/SPRING BOOT · SQL & NoSQL

PROFESSIONAL SUMMARY

Full-stack software developer with nearly 5 years of experience designing, building and running web applications end to end: React/TypeScript front ends with Redux Toolkit and React Query, Node.js/Express and Java/Spring Boot REST and GraphQL APIs, SQL and NoSQL databases, real-time WebSockets, Kafka messaging, Docker, CI/CD and AWS/Azure deployments. Delivered 8 internal tools and an external research portal handling ~50–60 deposits a month at DSHB, 15+ healthcare API endpoints and 3+ operational dashboards at Optum Rx, and backend services for a 10-language localization platform at TIBCO. Known for clean, tested code (Jest, React Testing Library, Cypress, JUnit, Postman), performance tuning, secure authentication and role-based access, production troubleshooting, and clear communication with technical and non-technical stakeholders in Agile teams.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript (ES6+), Java, SQL, HTML5, CSS3
Frontend: React, Next.js (App Router), Redux / Redux Toolkit, Context API, React Query, Vite, Tailwind CSS, Ant Design, Responsive & Accessible UI (WCAG 2.1)
Backend & APIs: Node.js, Express, Spring Boot, REST & GraphQL APIs, Microservices, Socket.io (WebSockets), JWT Auth, Role-Based Access Control
Databases: PostgreSQL, MySQL, MongoDB, Redis, Spring Data JPA/Hibernate, Schema Design, Indexing, Query Optimization
Integration: Apache Kafka, Third-Party REST APIs, SFTP File Exchange, NetSuite (SuiteScript, RESTlets)
Cloud & DevOps: AWS (EC2, S3, CloudWatch, IAM), Azure Blob Storage, Docker, GitHub Actions, CI/CD, Linux
Testing: Jest, React Testing Library, Cypress, JUnit, Postman, Supertest, Unit, Integration, End-to-End & API Testing
Tools & Practices: Git/GitHub, Jira, Confluence, Agile/Scrum, Code Reviews, Technical Documentation, GitHub Copilot

WORK EXPERIENCE

Application Developer — Feb 2026 – Present

DSHB (Developmental Studies Hybridoma Bank) • Iowa City, IA

- Design and build internal and external web applications with TypeScript, React, Node.js/Express and MySQL, delivering 8 internal tools and portals used daily by ~15 staff, from requirements and database design through testing, deployment and support.
- Built the DSHB Depositor Portal (React/TypeScript front end, layered Node.js/Express REST API, MySQL), moving external researchers' antibody and hybridoma deposits from email to an online submit-and-track workflow that handles ~50–60 deposits a month.
- Secured the portal's API with JWT authentication and role-based access control in Express middleware, so researchers see only their own submissions while authorized staff review and manage the full dataset.
- Designed a normalized MySQL schema for researchers, institutions, antibody/antigen data and review status with foreign keys and indexes, and added connection pooling; search and list pages that used to sit on long loading spinners now load noticeably faster.
- Managed client state with Redux Toolkit and Context API and server data with React Query, and built reusable React components and shared API modules used across the internal tools.
- Replaced spreadsheet-based processes with React forms, validation, dashboards and workflow screens, including a sales dashboard built with Ant Design Charts on NetSuite data.
- Built and maintain 5+ third-party integrations (Celigo, SuiteCommerce Advanced, Athos Commerce, Bioz, DocuSign) with the NetSuite ERP using SuiteScript, RESTlets and REST APIs.
- Automated a weekly SFTP report from ERP data, saving staff about an hour of manual export work every week.
- Built a React blog interface fed by NetSuite REST APIs so non-technical staff publish website content without code changes, with email alerts on publish success or failure.
- Added a real-time Socket.io feature and improved front-end performance with React.memo, Lighthouse and Chrome DevTools profiling.
- Test with Jest, React Testing Library, Cypress and Postman, covering the main user flows and API contracts. Ship website and application updates at least monthly through Git pull requests, code reviews and staged deployments.
- Mentor 2 interns and train new staff; write user guides and technical documentation for every tool released.

Application Developer — Aug 2023 – Jan 2026

Optum Rx • Remote

- Developed and supported full-stack healthcare applications with React, Node.js/Express, Java/Spring Boot, MongoDB, PostgreSQL and Redis, giving pharmacy fulfillment teams one view of medication inventory, prescription dispatches, shipments and home-delivery status.
- Built and maintained 15+ REST and GraphQL API endpoints for medication intake, inventory updates, prescription dispatch, shipment tracking and delivery status, with request validation, authorization and consistent error handling.
- Developed Java/Spring Boot microservices with Spring MVC, Spring Data JPA/Hibernate and Spring Security on PostgreSQL, using Apache Kafka for event-driven processing between services.
- Built 3+ responsive operational dashboards used by internal fulfillment staff, with Redux Toolkit for shared UI state, React Query for server data, Tailwind CSS and Ant Design.
- Created reusable table, filter and form components with consistent loading, empty and error states shared across screens.

- Designed MongoDB collections for medications, inventory transactions, dispatch orders and delivery history, with compound indexes on the most-filtered fields (fulfillment center, status, date).
- Added Redis caching for frequently requested inventory and dispatch metrics, with cache invalidation after writes so dashboards stayed current.
- Followed HIPAA-focused data handling and access-control practices, limiting each user to the data their role required.
- Containerized services with Docker and supported deployments on AWS (EC2, S3, CloudWatch, IAM) and Azure Blob Storage, automated through GitHub Actions CI/CD.
- Wrote unit, component and API tests with Jest, React Testing Library, JUnit and Postman, covering the critical fulfillment flows before each release.
- Resolved ~10–15 production issues a week by reproducing behaviour, reading CloudWatch logs and tracing requests across React, Node.js, MongoDB and Redis, then shipping verified fixes.
- Owned Jira tickets end to end in a 25-person Agile team, reviewed pull requests and wrote technical documentation.

Associate Globalization Developer — Aug 2021 – Nov 2022

TIBCO Software (now Cloud Software Group) — Localization Engineering • Hyderabad, India

- Developed backend services in Java and Spring Boot for MOLEE, TIBCO's internal translation-management platform supporting ~10 languages, with separate service, business and data-access layers.
- Designed and maintained REST APIs connecting the platform with internal build systems and external translation vendors, handling JSON/XML payloads, validation, error handling and translation-job status updates.
- Built Java components that validated XLIFF, .properties and JSON resource files (structure, required keys, character encoding), stopping broken files before they reached product builds.
- Used Spring Data JPA and SQL to track projects, languages and job status, and sped up processing by removing redundant database calls and consolidating queries.
- Containerized Spring Boot services with Docker and deployed and debugged them on AWS (EC2, S3, CloudWatch) through CI/CD pipelines across development and staging.
- Wrote unit and integration tests with JUnit covering business logic, validation, database access and error cases.
- Resolved ~10–15 localization defects a week (character encoding, date/number formatting, UI text rendering) with QA engineers, verifying fixes before release.
- Gathered requirements, wrote user stories and supported UAT with localization specialists and stakeholders in an Agile team, and supported production releases.

PROJECTS

Playverse – 3D Game Hub | React, TypeScript, Babylon.js, Node.js, Express, Socket.io, MongoDB, PWA | Live · GitHub

- Full-stack game platform with 4 realistic 3D games, accounts, leaderboards and an installable Android app; includes enemy AI (vision cones, A* path finding), procedural worlds and real-time Hide & Seek rooms on a server-authoritative Socket.io game server.
- Front end: React 19, TypeScript, Ant Design and React Query with lazy-loaded game routes and service-worker caching; back end: Express REST API with JWT, Zod validation, rate limiting, MongoDB leaderboard aggregations and anti-cheat score checks.
- Covered by 11 automated API and multiplayer tests; deployed on Render (static site + API service) with MongoDB Atlas and packaged as an Android app.

Expenso – Expense Tracker with AI Categorization | MongoDB, Express, React, Node.js, Chart.js, Ollama (Llama) | GitHub

- MERN app for tracking spending with charts and budgets; imports bank-statement CSVs and uses a local LLM to categorize transactions and summarize each month.
- Sends transactions to the model in batches with few-shot examples while totals are computed in code, so summaries never invent numbers; backed by 22 automated tests.

Ask Past Me – Voice Journal Android App | React Native, Expo, SQLite | GitHub

- Offline-first voice journal that records daily entries and replays what you said on the same day in past years, with searchable notes, reminders and fingerprint lock.
- Stores entries on-device with SQLite full-text search and ships Android builds through Expo EAS.

EDUCATION

M.S. in Computer Science — **Dec 2024**
Saint Louis University, St. Louis, Missouri, USA

B.Tech in Computer Science — **Jul 2021**
Gokaraju Rangaraju Institute of Engineering & Technology, Hyderabad, India
